

## Data Project 1

For this project, we worked in a group of two people. The hardest part of the project was something we did not expect. Throughout our time working together, we hit many roadblocks because of our disagreements. The first disagreement we had was what we wanted our data to be about. It seems very trivial looking back, but in the moment, we were both too passionate and strong-headed to stand down.

That was only the first of our disagreements. It is interesting working on code with another person instead of by yourself. It is a completely different experience compared to working by yourself. We definitely had to be more aware about putting comments in the code explaining what we were doing and also making sure our code was organized and readable.

It is interesting to work in a group, especially on something with code, because the need for communication is even more important. When you are working with code at school, you are usually working alone. This is definitely not how the real world is, so we really enjoyed this experience. We both definitely learned and grew a lot.

On the contrary, the easiest part of the project was getting the work done. We were both organized and on top of things, so it was easy to get things done even with all the disagreements we had. This definitely not what we expected would be the easiest part, but that is how things turned out.

We are sure that we will come into contact with similar things like this project in the future. Data is everywhere, and gaining this exposure and experience working with it is essential to building our careers. Knowing how to retrieve, convert, modify, and store the data are the primary steps to begin working with data for whatever purpose you need, whether it is for another school assignment or at a job in the future.
